

ABSTRACT

Stable pharmaceutical formulations can be obtained
by mixing a pharmaceutically useful benzamide derivative
5 or a pharmaceutically acceptable salt thereof with
additives that do not easily produce degradation
products, blending an organic acid salt, an amine
compound, and an inorganic basic substance, producing
solid formulations by the dry granulation method, and
10 further adjusting the pH of the liquid formulations to 4
to 12. Pharmaceutical formulations that produce little
degradation products and that are stable enough to be
used as medical drugs can be obtained.
